AbilityNet Factsheet – September 2015

Repetitive strain injury (RSI) in the workplace

This factsheet looks at repetitive strain injury (RSI) – the term most often used to describe the pain felt in muscles, nerves and tendons caused by repeated movement and overuse. It looks at the symptoms and causes of RSI (also known as Work Related Upper Limb Disorders) and the easy steps that individuals or employers can take to protect themselves or their staff.

It is important that employers understand their legal responsibility to provide any ‘reasonable adjustments’ to protect their staff from injury and prevent discrimination. Computer use is one significant cause of RSI and this factsheet includes practical information on both reducing the risk and responding effectively to any cases that may arise in an office environment.

Section 12 gives details of all the services that AbilityNet provides to reduce the risk and impacts of RSI on businesses, charities and individuals.

Links to other helpful resources are given in Section 13.

13. Useful links and resources  
14. About AbilityNet
1 What is RSI?

Repetitive strain injury (RSI) refers to work-related injuries to the muscles, tendons, nerves and soft tissue in our upper limbs. It usually affects the neck, shoulders, forearms, elbows, wrists and / or hands. RSI is a painful and potentially debilitating condition that, if left untreated, can lead to permanent damage.

RSI is quite often called something else. It is a kind of musculo-skeletal disorder (MSD) that is sometimes referred to as an upper limb disorder (ULD) or a work-related upper limb disorder (WRULD). It is also sometimes known as a cumulative trauma disorder or occupational overuse syndrome.

2 What are the symptoms of RSI?

There are two main types of RSI. In type 1 RSI, localised pain is the result of a recognised medical condition – such as tendonitis, cellulitis or carpal tunnel syndrome. In type 2 RSI, no specific diagnosis can be made and the injury is often referred to as non-specific upper limb pain or diffuse RSI.

RSI symptoms can vary but often include:

- Pain or tenderness
- Stiffness or joint restriction
- Tingling or numbness
- Cramping
- Swelling in the hands or forearms
- Referred pain – where pain is felt in a different part of the body to the one that is injured.

3 Why is RSI important?

Statistics from the Labour Force Survey suggest that there are over 200,000 cases of work-related upper limb disorders (ULD) every year in Great Britain.

In addition to the pain and discomfort experienced by so many individual workers, RSI also carries significant costs for employers.

The Health and Safety Executive (HSE) estimate that 3.2 million working days were lost in 2013/14 due to ULDs – with each person affected taking, on average, 15.9 days off work.
4 What causes RSI?

RSI can be caused or made worse by any type of work that requires you to use your arms to carry out repetitive tasks.

The injury occurs as a result of overusing and straining muscle and tendons in the upper body. The most significant risk factors with the potential to cause RSI include:

- poor posture or activities that require you to work in an awkward position (due to improperly adjusted furniture / equipment and poor layout of workstations)
- carrying out repetitive tasks for long periods without suitable rest breaks
- poor working environment and organisation.

RSI is most commonly caused by repeated actions that are carried out on a daily basis over a long period. A variety of office-type jobs can lead to RSI, such as data entry, typing at a computer or working in a call centre.

It is important that your working environment is arranged, and your equipment set up, to enable you to work comfortably. Your work should also be organised to reduce the risk of you developing RSI.

5 Can RSI be treated?

If you develop any symptoms of RSI, you should speak as soon as possible to your employer or occupational health specialist about any ways that you could modify your working environment and tasks to relieve your discomfort or pain.

More detailed advice on the kind of adjustments you might make is given below. However, if your symptoms persist despite attempts to modify your work activities then you should contact your GP.

There is no single treatment for RSI. NHS Choices (see section 13) gives helpful information on a number of different treatments that can help with the condition. Depending on the specific diagnosis, possible treatment options for RSI include:

- physiotherapy
- heat or cold packs, elastic supports or a splint
- medication
- steroid injections
- surgery.
Some long-term sufferers of RSI use other types of complementary therapies (such as yoga and acupuncture) and relaxation techniques to help relieve their symptoms.

It is important to address any possible symptoms of RSI as early as possible because, without appropriate adjustments and any necessary treatment, it may progress from mild to severe.

- Early stage RSI (mild) – Aches and pain or tiredness occur during work but improve with rest. Performance may not be affected. This stage may last weeks or months but is reversible.

- Intermediate stage RSI (moderate) – Pain and tiredness occur early in the work shift, persist away from work and may disturb sleep. Capacity for repetitive work may be reduced. Physical signs (e.g. swelling of the tendon areas) may be visible. This stage may last several months.

- Late stage RSI (severe) – Pain, tiredness and weakness persist even with complete rest. Sleep is often adversely affected and you may be unable to perform even light tasks at home or work. This stage is sometimes irreversible and you may never get back full use of the affected part of your body.

Not everyone goes through these stages in the same way and each individual case of RSI is unique. Nonetheless, the first pain, numbness or tingling experienced is a clear signal that you need to act and that your affected muscles and tendons need to rest and recover.

Early intervention is key. A good physiotherapist – preferably a member of the Chartered Association of Physiotherapists (MCAP) – can provide a number of simple exercises to help alleviate early symptoms of RSI, hopefully leading to full recovery.

6   What should employers do to prevent RSI?

Employers have a legal duty to try to prevent work-related RSI and to ensure that anyone who already has the condition does not get any worse. In addition to the requirement to provide safe working conditions, employers also have a common law ‘duty of care’ towards their staff.

Under the Health and Safety Act, employers must carry out a risk assessment of any task or equipment that may cause injury. This includes the set up of computer equipment and workstations. For staff who regularly use computers or
laptops, employers must follow the guidance given in the Display Screen Equipment (DSE) Regulations.

To reduce the risk of RSI or any other harm or injury, employers should also:

- consult employees on potential risks arising from their work
- consider changing the way work is organised
- provide clear instructions, information and training on any measures being taken to control the risks
- help sufferers when they come back to work.

Employers who do not meet their statutory responsibilities for health and safety, or who fail in their duty of care, may be taken to an employment tribunal. One study by the HSE found that most of the compensation claims made against call centre operators came from RSI sufferers.

Employers could also be vulnerable to claims of discrimination under the Equality Act, if they fail to make 'reasonable adjustments' for a disabled employee.

7 How can RSI be prevented?

Prevention of RSI is far easier than cure. Even if you do not have any symptoms it is certainly worth thinking about how you can adapt your work to reduce some of the main risk factors by:

- adjusting your workstation to ensure it is set up properly for you to work comfortably
- using your computer equipment correctly to reduce potential strain
- taking short, regular breaks (every 20-30 minutes) from protracted keyboard / screen work, and varying your tasks as much as possible.

In many respects, the way workstations were traditionally set up exacerbated the risk of RSI. However, even when workstations are set up well, some people may still require or benefit from additional hardware or software 'solutions' to help relieve their RSI symptoms.

8 How should workstations be set up?

Many injuries result from work surfaces being too high or too low, or requiring people to stretch and strain in awkward positions / angles.
Therefore, making sure that your desk and computer equipment are properly set up and adjusted is the first step in preventing RSI.

Maintaining a good posture (with a supported, erect back and relaxed shoulders) and adjusting your chair to the correct height that enables you to use the keyboard with your forearms and wrists straight – in a neutral position, parallel with the floor – is most important.

Simple measures using standard equipment that help to prevent RSI are:

- resting your feet flat on the floor, or on footrest
- sitting central to the curve on any curved desk
- placing your screen at eye level and directly in front of you
- having your keyboard directly in front of you, with a space at the front of the desk to rest your wrists when you are not typing
- positioning your mouse as close to you as possible so you can use it with your wrist straight, avoiding awkward bending
- using a ‘compact’ keyboard without a number pad (if you do not do much number work) so that the mouse can be brought in closer still
- avoiding reflections from overhead lighting and sunlight
- using a document holder, to avoid bending your neck – position this centrally (with your monitor to the side) to also avoid twisting (if you tend to look at documents more than the screen)
- touch typing, to spread the load
- using predictive text and auto-correct features, to reduce keystrokes
- learning common keyboard shortcuts, to reduce use of the mouse
- slowing your mouse down, to reduce muscle tension.

See the AbilityNet factsheet on *Workstation ergonomics* for more detailed advice on how best to achieve a safe, comfortable and productive workstation.

9  **How can computers be adapted to help prevent RSI?**

Both Windows-based and Mac computers have accessibility features built into their operating system. *My Computer My Way* is an interactive web-based tool developed by AbilityNet that shows people how to take advantage of these accessibility features. As well as helping to make computers much easier to use for anyone with a sight, hearing or cognitive impairment, *My Computer My Way* also assists people with motor problems and helps to reduce the risk of RSI by making it easy for users to adapt their computer, mouse and keyboard and, also, the way they work.

10  **What other aids can help prevent RSI?**

Apart from the adjustments you can make to standard input devices, various non-standard keyboards and mice are available that can improve the positioning of your hands and wrist – thereby reducing strain.

Possible options include:

- ergonomic keyboard, to aid touch typing (with a split between the keys operated by each hand)
- separate numeric keypad
- palm and wrist supports
- wireless mouse
- ergonomic mouse (which requires less gripping between your thumb and little finger)
- vertical mouse (which avoids having to twist your wrist to move the mouse on a horizontal surface)
- bar mouse (which avoids any gripping)
- trackball mouse (which also avoids any gripping).

The AbilityNet information sheet on *Keyboard and mouse alternatives* provides more detailed information on a wide range of alternative devices and options.
Alternatively, voice recognition software can be used for dictating text and for starting and controlling programs through spoken commands. Further information is available in the AbilityNet factsheet on *Controlling the computer with your voice*.

If you are getting symptoms in your dominant hand, it is not advisable to switch mouse use to your other hand. It is not so strong and could well soon display similar difficulties. Learning keystroke alternatives to limit mouse use is a preferable strategy, combined with early assistance from a good physiotherapist.

11 What about laptops, tablets and smartphones?

For many years computers were mainly used by people at work and only at their desk. But the growth of computer gaming and social media, and the way we use computers, laptops, tablets and smartphones in our daily lives, means we use them a lot more now – at work, rest and play.

The growing numbers of people working on laptops and tablets from home, at telecentres, on trains, and in cafés and cars – also clearly carries additional risk associated with poor posture. So, despite greater awareness, the risks of RSI may be increasing due to our increasing use of computing devices for both mobile working and leisure activities.

The main problem with laptops is that the keyboard is attached to the screen, with the poor posture this creates causing neck, back and arm problems. To reduce such risks when working with a laptop for sustained periods, good practice is to:

- use a separate keyboard, screen and mouse
- place your laptop on a raiser (to bring the screen closer towards eye-level)
- If using neither an external keyboard or mouse (not recommended for long periods of work), make sure that the laptop is on a stable base and not your lap
- take regular short breaks to relieve upper body tension
- sit up straight with your back supported.

12 How can AbilityNet help address RSI?

AbilityNet is a leading authority on accessibility and assistive technologies. We can assist individuals, charities and employers by providing:
- advice and information
- workplace assessments
- consultancy services.

**Our Workplace Assessment Service**

This factsheet explains some of the options that may be useful in preventing or dealing with RSI in the workplace, but it cannot provide recommendations to suit each individual’s particular needs.

AbilityNet’s Workplace Assessment Service provides a one-to-one holistic review. This will not only look at your immediate workstation, it will also consider work patterns, regular tasks and other factors which can impact on health and productivity.

One size does not fit all. We believe that each case is unique and that individual attention is vital. Superficially similar cases may demand quite different approaches, and the solutions we propose are arrived at through discussion, evaluation of all the relevant circumstances and the trial use of alternative devices (where these are recommended).

Our assessments integrate personal and technical considerations to arrive at sound and realistic suggestions, documented in a report. To find out more about our Workplace Assessment Service, please visit [www.abilitynet.org.uk/workplace](http://www.abilitynet.org.uk/workplace) or call 01926 465 247.

**DSA/Student Assessments**

If you have a disability and are in higher or further education, you may qualify for a Disabled Students Allowance (DSA). If you are eligible you will receive a free assessment and may qualify for a grant towards any adjustments that you might require. This could help with the costs of buying a new computer or any other specialist equipment you might need.

For more information, visit [www.abilitynet.org.uk/dsa](http://www.abilitynet.org.uk/dsa) or call 01926 464 095.

**Consultancy services**

Our expert consultants are also available to assist employers who wish to take a broad, longer-term view in designing computer systems and associated work processes. Our experience and expertise can help you to achieve safe, healthy and effective working procedures.

To find out more about AbilityNet’s consultancy services, call 01962 465 247 or email [sales@abilitynet.org.uk](mailto:sales@abilitynet.org.uk)

AbilityNet factsheets

AbilityNet’s library of factsheets and information sheets provides an extensive range of practical advice about specific conditions and the hardware and software adaptations that can help people of any age use computers to fulfil their potential. Topics covered include:

- Workstation ergonomics
- Keyboard and mouse alternatives
- Controlling the computer with your voice
- and many more.

All these resources are free to download from www.abilitynet.org.uk/factsheets

My Computer My Way

My Computer My Way is a free interactive tool developed by AbilityNet that makes any computer, tablet and smartphone easier to use. It covers all the accessibility features of all mainstream operating systems, including Windows, Windows Phone, Mac OSX, iOS and Android.

Use it for free at www.mycomputermyway.com

Health and Safety Executive (HSE)

The Health and Safety Executive (HSE) is the national independent watchdog for work-related health, safety and illness. Its main aim is to secure the health, safety and welfare of people at work and protect others from risks to health and safety from work activity.

The HSE also plays a major role in producing advice on health and safety issues, and guidance on relevant legislation. The role of enforcement is split between HSE and local authorities depending on the business sector.

The following publications most relevant to managing RSI can be downloaded from the HSE website at www.hse.gov.uk/a-z/u.htm#uld

- Managing upper limb disorders in the workplace. A brief guide, HSE, August 2013
- Working with display screen equipment (DSE). A brief guide, HSE, April 2013
Institution of Occupational Safety and Health (IOSH)

IOSH is the chartered body for health and safety professionals and a world leader in health and safety training. The IOSH OH Toolkit provides information, guidance and training materials on a wide range of conditions, including upper limb disorders, to help you tackle occupational health problems.

NHS Choices

NHS Choices is a reliable source of medical information on the symptoms, causes, diagnosis, treatment and prevention of repetitive strain injury.

Get more information at:

RSI Action

RSI Action is a national charity that aims to facilitate:

- the prevention of the conditions known collectively as repetitive strain injuries
- the relief of sickness, hardship and distress amongst those suffering within the UK from RSI conditions.

Get more information at www.rsiaction.org.uk
14 About AbilityNet

AbilityNet is the national charity that supports people with any disability and of any age. Our specialist services help disabled people to use computers and the internet to improve their lives, whether at work, at home or in education. We offer:

- free advice and information
- accessibility services
- DSA/student assessments
- workplace assessments
- IT help at home
- IT volunteers.

Support us

Visit [www.abilitynet.org.uk/donate](http://www.abilitynet.org.uk/donate) to learn how you can support our work.

Contact us

- Telephone 0800 269 545
- Email enquiries@abilitynet.org.uk
